EXHIBIT

Unmodified Bakelite® basic amide

Many applications and diagnostic methods have used or have been developed. However, the following sections will emphasize the diagnostic methods. Although these sections are not complete, they do give major diagnostic procedures for a strong body. After we have studied the basic systems, the most important ones are discussed.

For the formulation of one component binder systems (steel, hardener and resin) the most important one is of course the curing reaction, which is suspended in the epoxy resin. Only an elevated temperature is able to decompose the resin and begin the curing reaction. This curing time at 100°C is about 30 min. (however, accelerators can be used in the formulation which then allows a low temperature curing).
